

SIREX® Floor underlays

Indoor

Fitness

If a hard floor is to be used for fitness activities, durable elastic flooring is required. The SIREX® flooring system range includes a floor underlay that gives additional elastic and acoustic properties to hard laminate or composite laminate floors.

Sport

One of the main conditions to be met by sports flooring that is used for different competitive indoor sports is the prevention of injuries. The SIREX® sports floor underlays have excellent, durable elastic and shock-absorbing properties and can be supplied in various standard thicknesses.

Outdoor

Sport

An absolute necessity for safe activities on artificial grass is a shock-resistant, shock-absorbing, sports-technical layer to prevent injuries. Within the SIREX® flooring systems range, a stable, outdoor, sports-technical floor underlay has been developed which can be very easily fitted underneath synthetic turf and which requires little or no maintenance. The excellent material properties and the net-reinforced core guarantee a long life for the sports field. Fitted with drainage holes as standard, this can be supplied in various thicknesses and (composite) densities depending on the uses to which the sports field is put.
